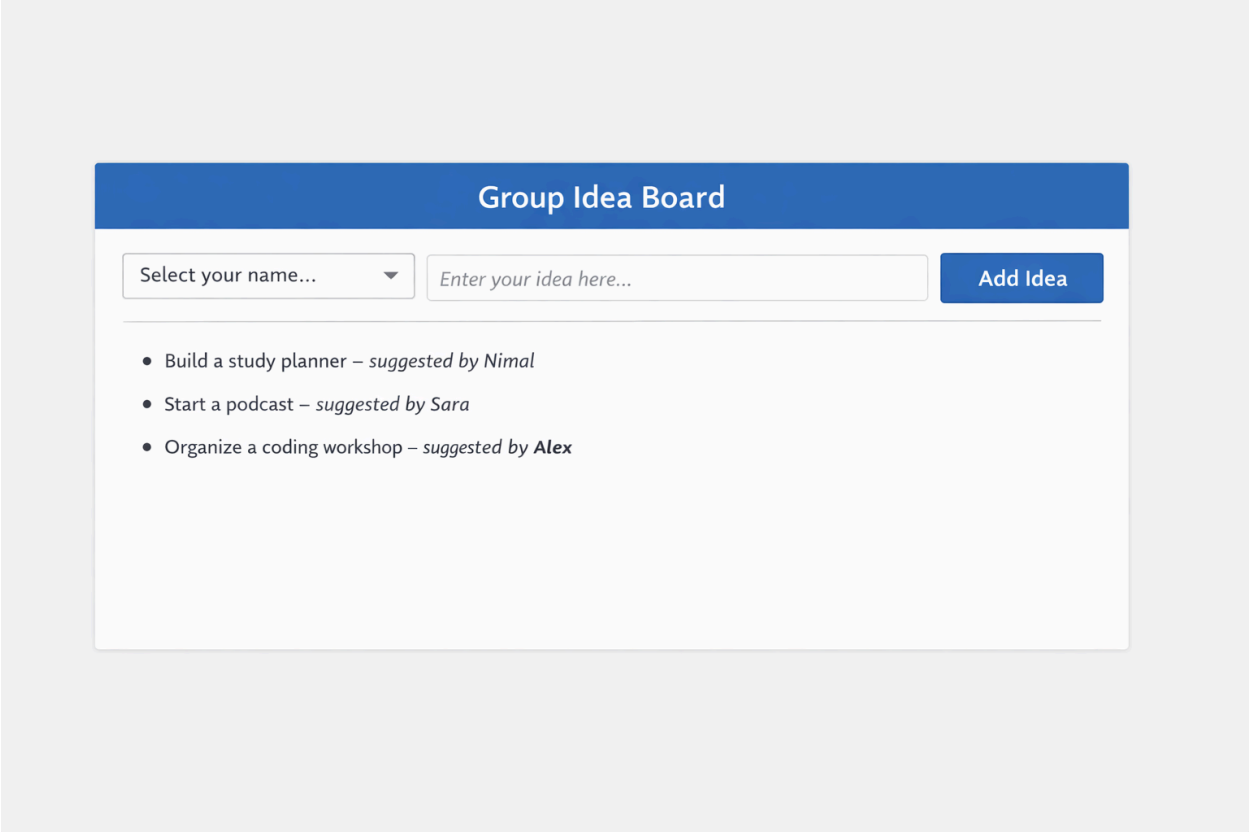
Day 03 – Task Sheet

Build a Group Idea Board (Using AI Tools)

Objective

Work as a team to design and build a simple interactive web interface based on a **sample UI given below (*Note: You can come up with your own design*)**.



Part 1 – Group Roles

Each group must assign the following roles.
Rotate roles during the session.

Coder

- Uses the laptop
- Copies or writes the generated code
- Saves and runs the application

Prompter

- Writes prompts for the AI tool
- Explains what the group wants to build

QA / Reviewer

- Tests the interface and checks whether it behaves as expected

Part 2 – Create a GitHub Repository

1. One group member should create a new repository on GitHub.

   Example repository name: group-idea-board

2. Clone the repository to your local machine.

   Example command:git clone <repository-link>

3. Create a project folder and add your files.

   Example file: index.html

Part 3 – Add Group Members as Collaborators

The repository owner must add all group members as collaborators.

Steps:

1. Open the repository on GitHub
2. Go to Settings
3. Click Collaborators
4. Click Add people
5. Enter the GitHub usernames of your group members

Each member must accept the invitation.

Part 4 – Build the Interface

Use the **sample UI image provided above** and build a similar interface.

Example display:

Create a study planner – suggested by Nimal

Part 5 – Improve the Appearance

Use AI tools to improve the visual design of the page.

Enhance the interface by adding:

- Better **layout and spacing**
- **Colors or styling**
- A **clear list layout for ideas**
- A visually appealing **button design**

The goal is to make the interface **look clean and readable**.

Part 6 – Add Additional UI Elements

Enhance the interface further by adding at least **two additional elements**.

Examples include:

- A **header section**
- A **footer**
- A **logo or icon**
- A **background design**
- A **section showing the total number of ideas**
- A **clear button to reset the input field etc…**

Use AI tools to help generate these improvements.

Part 7 – Testing the Application

Run your application in the browser and test it as a group.

Check whether:

- Ideas appear correctly in the list
- Different names can be selected
- The interface is easy to use

Make adjustments if necessary.

Part 8 – Documentation

Each group must submit a short document containing:

1. Role Log

Record who performed each role during the session.

Role	Temporary Number(s)
Coder	
Prompter	
QA	

2. Prompts Used

Write the **main prompts** you used with the AI tool to generate the code.

3. Screenshot of the Final Interface

Include a screenshot of your final interface.

4. Github Link

The GitHub repository link of the project.

Requirements:

- The repository must contain the project files
- All group members must be added as collaborators
